

**Your NestJS app works perfectly on your machine...
but crashes on someone else's. Why?**

The Problem

- "Works on my machine" is one of the biggest deployment problems.
- Different OS, Node.js versions, or dependencies cause failures.

What is Dockerization?

- Packaging an application with all its dependencies into a Docker image.
- Ensures the app runs the same everywhere.

Why Docker for Microservices?

- Consistent environments.
- Easy deployment.
- Better scalability.
- Faster onboarding.
- Platform independence.

What is a Docker Image?

- A read-only blueprint containing the application and its dependencies.

What is a Docker Container?

- A running instance of a Docker image.

What is a Dockerfile?

- A file containing instructions to build a Docker image.

What is a Multi-stage Build?

- Using multiple build stages in one Dockerfile.
- First stage builds the application.
- Final stage contains only production files.

Development vs Production Images

- Development includes source code and dev dependencies.
- Production includes only compiled code and production dependencies.
