

Your microservices are running... but are they healthy? Without monitoring, you're flying blind.

The Problem

- Running services doesn't mean healthy services.
- Failures can happen silently without monitoring.

What is Monitoring?

- Continuously observing the health and performance of applications.
- Helps detect issues before they impact users.

What are Metrics?

- Numerical measurements of system behavior.
- Examples: CPU usage, Memory usage, Request count, Response time, Error rate.

What is Prometheus?

- Open-source monitoring and metrics collection system.
- Pulls metrics from applications at regular intervals.
- Stores time-series data efficiently.

What is Grafana?

- Open-source visualization platform.
- Creates beautiful dashboards using Prometheus metrics.
- Helps teams monitor applications in real time.

Monitoring vs Logging vs Tracing
